The diagram illustrates the cloning strategy for pCON6. It shows the construction of pSmaU3del (2792 bps) from pBAGN (7018 bps) and pSmaU3del. pSmaU3del is then digested with BamHI and self-ligated to form pBAGNB (3946 bps). pBAGNB is then digested with BamHI and self-ligated to form pCON6 (4097 bps). The diagram includes restriction enzyme sites (SmaI, ClaI, SpeI, XbaI, HindIII) and their positions on the plasmids.
